🎓 FORMATION

Bachelor in Business Computing

Higher Institute of Management of Tunis (ISGT)

2022 – 2025 | Tunis

- **Speciality : Business Information System (BIS)**
- Software Development
- Business Process Management & Accounting
- Problem Solving

🧠 SKILLS

Programming Languages: JavaScript | Python
| Java | C#

Frameworks: Vitejs | NodeJs | Angular & spring boot | Flask | Django

Devops: Docker | Git&Github

📁 PROFESSIONAL EXPERIENCE

PFE internship in Apromed

02/2025 – 05/2025

- Design and development of a scalable platform modernizing internal management and optimizing business processes
- Integration of AI modules (FaceID authentication, Archiving and Scanning of invoices via an OCR, Google Gemini reporting and n8n automation) to strengthen security, automation and decision-making

Summer Internship at OORB Robotics

08/2024 – 08/2024 | Tunis

- Development of interactive models using Figma to structure the ergonomics and visual identity of the site
- Full-stack development and deployment of the web platform, optimized for performance

Summer internship at Vermeg

08/2023 – 08/2023 | Lac , Tunis

- Design and development of an employee management application in Angular (front-end) and Spring Boot (back-end)

👤 EXTRACURRICULAR ACTIVITIES

Smart Marketing Advisors (SMA) Junior

Enterprise, IT Pole Project Manager — 2024-2025

📁 PROJECTS

Biometric Authentication Application

- Development of a **Deep Learning**-based facial authentication module using the Siamese Neural Network approach for secure verification.
- Training on a custom dataset using **Mediapipe for facial** extraction and the **Adam** optimizer to improve robustness and generalization.
- Deployment of the application via Kivy for a seamless cross-platform interface.

Platform for managing requests for capital participation

- Design of a dynamic site in React.js with PHP API and MySQL database (phpMyAdmin) to manage all front- and back-end processes.
- Development of a module for submitting, monitoring and validating financing requests from startups and investor participation.

Intelligent document flow management system

- Automation of document management using **NLP models** (Hugging Face, Haystack) for document classification, search and summarization.
- Seamless integration between legacy and modern systems via **REST and GraphQL APIs**.
- Dynamic workflow optimization to prioritize and adapt processing in real time.

IoT Intelligent Systems Simulation (Cisco Packet Tracer)

- Modeled an intelligent parking-slot system using proximity sensors and LED indicators to display real-time availability
- Built an intelligent cabinet prototype with door-status and temperature sensors for secure asset monitoring
- Created basic logic circuits in Packet Tracer to trigger alerts and status updates on a simulated PC dashboard
- Demonstrated end-to-end functionality by simulating live sensor data and automated actuator responses

Process Challenge Game – Multi-stage problem solving

- Development in Python of a competitive multiplayer game in three challenges: grid coloring under constraints, forest navigation with obstacles and zombie confrontation to maximize treasure collection. Each player chooses their strategy via a console interface.
- Implementation of a multithreaded engine to execute games simultaneously and performance comparison, based on backtracking techniques, dynamic programming and greedy approaches.
